

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

FOWLERINA EIGENMANN A PREOCCUPIED GENERIC NAME

In the *American Naturalist* for 1907, p. 767, Dr. Carl H. Eigenmann proposes very magnanimously the generic name *Fowlerina* for a genus of stethaprionine characins. He gives *Tetragonopterus compressus* Günther as the type.

The name, however, is antedated by *Fowlerina* Pelseneer, *Trans. Linn. Soc. London* (2), X., February, 1906, p. 149, proposed as a new genus of mollusks.

I therefore propose the generic name EPHIPICHARAX, and give *Tetragonopterus compressus* Günther also as the type. Apparently, two species are known from the Amazons, Guiana, Paraguay and eastern Brazil. The genus is remarkable for the peculiar scale-like predorsal spine, which fits into a depression in the back. It is closely allied with *Stethaprion* Cope.

SOME ADDITIONAL NOTES ON THE BLOWING OF SOILS

IN SCIENCE, Vol. XXVIII., pp. 653-654, I published an article on the "Blowing of Soils." I wish to add these further notes on the same subject.

It has snowed here (Nett Lake, Minn.) for practically one continuous week now and more than eighteen inches of snow has fallen in that time. The snow on the ground now is three and one half feet deep. Even the ice in the lakes is so pressed down by the additional weight of snow that the water rising on it on account thereof has stopped all lake transportation and travel. But to the subject. Yesterday with a nearly west wind, bearing a little to the north, with a velocity of probably eight miles per hour, the continuous snow that fell was so filled with dirt that it was brown. It was so conspicuous that even the Indians called my attention to the dirty snow. This dirt in the snow here was the product of a dust storm somewhere. With the snow three and one half feet deep here it

must have come from the country about Medicine Hat in Canada or from the northern part of the Dakotas. From conditions here it must at least have come five hundred miles.

MOSQUITOES POLLINATING ORCHIDS

In August, 1899, seven mosquitoes bearing pollinia of the tall green orchid, *Habenaria hyperborea*, were taken at a camp on the Medicine Bow Range in northern Colorado, at an altitude of 10,200 feet. Four individuals carried two pollinia each; three carried one each. The viscid disks were attached to the lower front of the head and in some cases partially covered the eyes.

The captures were made on a rainy day within a tent located at some little distance from the stream on the banks of which the orchid grew. Examination of a considerable number of spikes showed that pollinia had been removed from many of the flowers, but actual removal by mosquitoes was not observed. Mosquitoes were extremely abundant, only a relatively small number was examined and few carried pollinia, but the impression remains that this undetermined species of mosquito may be regarded as of some importance as an agent in the pollination of this *Habenaria*.

This observation was recorded in *The Plant World*, 3: 6, January, 1900.

PLUS AND MINUS AGAIN

DR. HALSTED's statement¹ on the use of the symbol + in Widman's arithmetic of 1489 is apparently in conflict with my own.² As neither Widman's book nor the descriptions of it in the *Bibliotheca mathematica*³ are readily accessible to most American readers, it may be well to give a fuller account. The
